

While not an expert on the technical intricacies in deploying wireless broadband networks, I have seen the benefits gained by communities and neighborhoods that have put the hard work into setting up such networks. These networks are great!

Normally, when technology brings us opportunities like this to communicate in better ways, I trust the free market to provide incentive to innovators to maximize the potential.

I think this technology could benefit from such free market competition. And I think the best way to ensure competition is as open as possible -- with as many players innovating as much as they possibly can -- is to increase the amount of unlicensed spectrum available.

Not every innovator can afford the high cost of licensed spectrum -- in fact, most can't, especially the newest and most cutting-edge players. In order for them to have an opportunity to further expand wireless networks' potential, it is vital that the amount of unlicensed spectrum be increased.
